Go Fundamentals

01 / Getting Started

What is Go?

Go is a compiled, statically typed language designed for building clear, reliable software. It combines a small language with fast builds, built-in concurrency, and a strong standard library.

Your first program

```
package main

import "fmt"

func main() {
    fmt.Println("Hello, Go!")
}
```

Save the code in a file named main.go, then run it with: go run main.go

A few useful ideas

- := declares and initializes a variable inside a function.
- Functions can return more than one value, often a result and an error.
- A package groups related Go source files.
- gofmt formats source code consistently.
